

Identifying Priority Habitats

This informal and relaxed course will help participants to recognise a range of priority habitats by identifying key indicator plant species. This course will include:

- The introduction of a range of priority habitats and their indicator species including meadow, acid grassland, heathland, pond, bog, rush pasture and fen.
- Botanical identification using a range of resources including keys.
- The opportunity to observe and discuss indicators for degraded or remnant conditions of these priority open habitats, in order to make informed decisions on the most suitable locations for woodland creation and other land management actions.
